

ECG ABNORMALITIES

Supporting information

What is the incidence of supraventricular tachycardia in the neonatal period?

A 2020 population-based study in Slovakia found that the incidence of supraventricular tachycardia in the first year of life was 1/4500 to 1/5000 (Bjeloševic, 2020).

A review of the subject (Calabro, 2008) states that: "Supraventricular tachycardias are observed in 0.1-0.4% of the paediatric population."
